

## Build a company-intelligence agent

One pipeline, start to finish: companies go in, judgment comes out, and it keeps itself running. Free-tier tools only — your choice which ones.

- 1 Source**  
A Google Sheet holds the list of companies. New rows should get picked up without a restart.
- 2 Enrich**  
Pull a few independent signals per company. At least one has to come from real browser automation, not a plain HTTP call.
- 3 Persist**  
Results land in a real database, not memory and not just a write straight back to the Sheet.
- 4 Judge**  
An LLM turns the signals into a structured verdict — a fit call, a confidence, a follow-up question. Reasoning over evidence, not a summary.
- 5 Sync back**  
The verdict goes back into the Sheet, authenticated properly.
- 6 Run itself**  
The pipeline should be able to fire on a schedule, plus be triggerable and queryable on demand.
- 7 Ship**  
Containerized, deployed, reachable by a real URL.
- 8 Wire it to GitHub**  
A workflow should check the code on every push, and a separate one should be able to kick the pipeline off on its own — no human clicking anything.

**Constraints:** free-tier keys/credits only. Everything else — languages, frameworks, providers, hosting — is your call. That's part of what we're evaluating.

### Working app link

A live, reachable URL we can open and try ourselves

### Git repo

With a README covering what you built and why

### Demo video

3–5 min: introduce yourself, walk through your approach, show it running live
